

Keep a LEVEL head with our floors

Eliminate the difficulties associated with getting a good floor finish using traditional screed

At Thermotech, such problems were highlighted during the installation of an underfloor heating system.

Knowing that flowing screed has been widely used on the continent for several decades, and in the UK for over 15 years on large commercial developments, we investigated the practicalities of bringing this process to smaller scale projects such as an individual house build, through to a shopping centre.

As a result of this we identified a process that we regard as the highest possible quality floor finish available. But don't just take our word for it; take a look at the facts below.

Over the past 5 years we have invested heavily to bring you the ultimate floor finish.

Take a look at why you should choose flowing screed from Thermotech ...

- Excellent finish typically achieves SR2 under BS8204
- Fast application - up to 1,000 m² per day
- Ideally suited for underfloor heating
- Protein free - will not harbour bacteria
- Environmentally friendly
- Application thickness 25mm to 80mm
- Foot traffic within 24 to 48 hours
